

- Select **Browse** under the **Select Sprites Directory** section

- Navigate to the folder that contains the sprites you want to use to create sprites and or object assets in your game maker project.

Sprites should be named with a prefix like s or spr. It can be anything, but all sprite names need to begin with it.

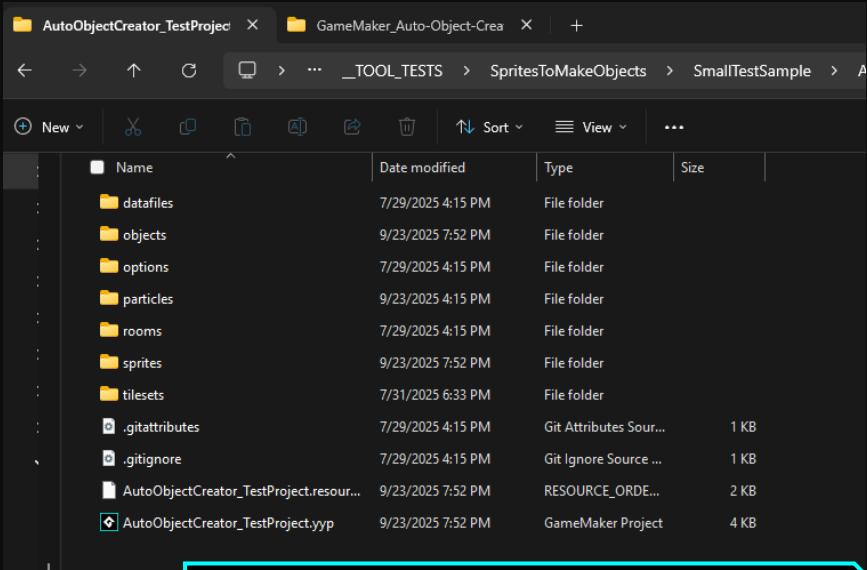

The folder you use should only contain sprites for import.

- Select **Browse** under the **Select Game Maker Project Directory** section.

Select Game Maker Project Directory:

Bottom Right

Select the sprite origin point from the dropdown selection.

- Enter optional Parent Object name and an optional list of Tags.

Parent Object Name:

oTestInherit

Leave empty for no parent object

You can either choose to give the name of a Parent object that exists in the project, leave empty for no Parent Object, or type in a new name for a Parent object

- When using an existing Parent Object it'll set all the new objects as children of the given object
- When typing in the name of a new parent object it'll create a blank object in game maker and set all the new objects as children of the new Parent object
- Leave blank for no Parent

Create Objects Create Sprites Create Both

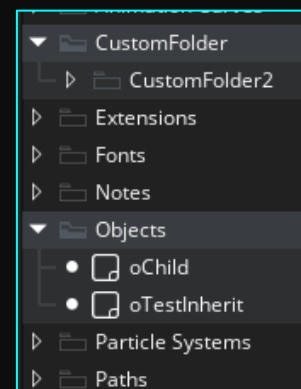

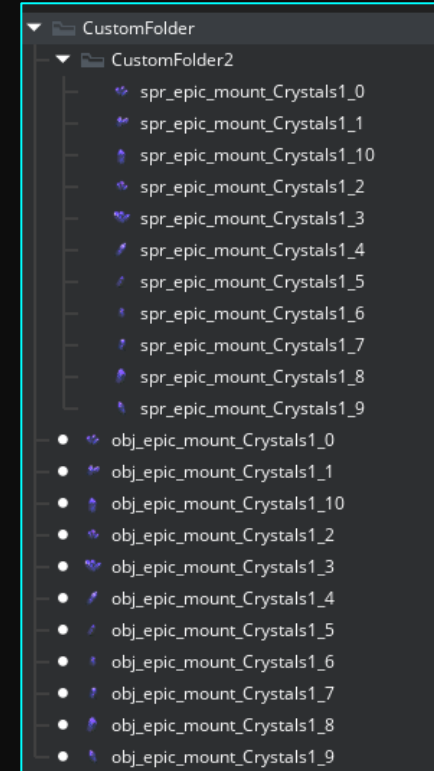

If sprites exist in your project with the same name, they will automatically be set as the sprite of the newly created Object

- If tags were set, they will only be applied to the new objects
- The existing sprites will not change their origin point to the selection set in the Batch Asset Creator

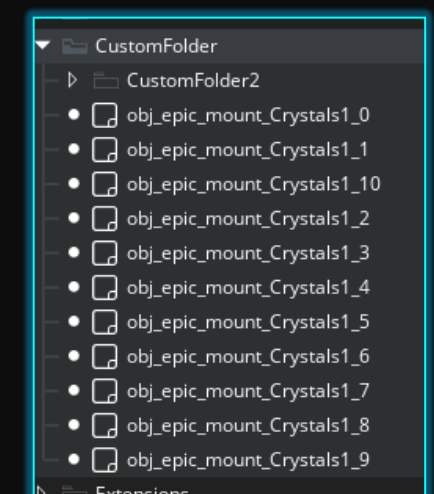

If sprites with the same name don't exist in the project the object assets will be created but will have no sprite set to them
